

Pocono AI™ Clinical Intelligence Briefing Workflow

Sentinel Node™ Operational Workflow

The Sentinel Node™ is designed to reduce clinician cognitive overload by preparing concise, auditable patient briefings entirely inside the client's local environment. The workflow emphasizes local inference, human review, zero telemetry architecture, and workflow-native assistance.

Core Design Principles

- Human-in-the-loop review
- Local-only inference
- Zero telemetry architecture
- Auditable retrieval provenance
- Workflow-native assistance
- Minimal clinician interruption
- Fast retrieval and summarization

1. Pre-Visit Patient Context Assembly

- Review upcoming schedules
- Retrieve approved patient records
- Search prior visit notes
- Locate imaging reports
- Retrieve medication history
- Identify prior authorization status
- Detect incomplete documentation
- Organize relevant historical timelines

2. Clinical Snapshot Generation

- Chief complaint and referral reason
- Recent symptom progression
- Surgeries and failed therapies
- Medication trials and admissions
- Prior authorization requirements
- Missing insurer documentation
- Clinical risk indicators and critical alerts

3. Local Retrieval-Augmented Search (RAG)

- Retrieve relevant internal chart data
- Surface supporting documentation
- Display provenance for all summaries
- Link generated statements to source records
- Prevent external transmission of PHI

4. During Visit Assistance

- Draft structured visit notes
- Surface related records when requested
- Track missing documentation
- Prepare downstream workflows silently in the background

5. Post-Visit Workflow Preparation

- Assemble prior authorization packets
- Organize supporting evidence
- Draft referral summaries
- Prepare insurance documentation
- Queue outputs for human review

Nursing and Administrative Support

- Inbox triage assistance
- Referral organization
- Callback summarization
- Lab categorization
- Administrative workflow compression

Sentinel Node™ Workflow Sequence

Operational Philosophy

The Sentinel Node™ is not designed to replace clinicians. It is designed to reduce workflow friction by organizing information, retrieving relevant records, and preparing structured clinical context inside a secure local environment. The clinician remains the final decision-maker at every stage.
